In the Claims

- 1. (Currently Amended) A process for enabling multiple programmers to modify behavior of an object executing on a computer system concurrently, the process comprising: identifying a first method and a second method to be performed on an object, wherein the object corresponds to an instantiation of a class;
 - developing the first method in a first application having a first subclass of the class, wherein a first application-specific object is an instantiation of the first subclass; and
 - concurrently developing the second method in a second application having a second subclass of the class, wherein a second application-specific object is an instantiation of the second subclass.
 - (Original) The process of claim 1 further comprising: invoking the first method, wherein the invoking the first method on the first applicationspecific object such that the object communicates as if the first method were performed on the object.
 - (Original) The process of claim 1 further comprising: invoking the second method, wherein the invoking the second method on the second application-specific object such that the object communicates as if the second method were performed on the object.
 - 4. (Original) The process of claim 1 further comprising: modifying the first method, wherein the modifying does not affect the second method.
 - (Original) The process of claim 1 further comprising:
 modifying the second method, wherein the modifying does not affect the first method.
- 6. (Currently Amended) A process for enabling multiple programmers to modify behavior of an object executing on a computer system concurrently, the process comprising: defining an abstract class for an object, the abstract class comprising:

- a first method calling a first application; and
- a second method calling a second application;
- developing the first method in a first subclass of the abstract class in the first application; and
- developing the second method in a second subclass of the abstract class in the second application.
- 7. (Currently Amended) An architecture A system for enabling multiple programmers to modify behavior of an object executing on a computer system concurrently, the system comprising:
 - an object corresponding to an instantiation of a class;
 - a first application having a first subclass of the class, wherein
 - a first application-specific object is an instantiation of the first subclass;
 - the first subclass comprises a first method comprising a first behavior of the first application-specific object; and
 - the first behavior of the first application-specific object corresponds to a first behavior of the object;
 - a second application having a second subclass of the class, wherein
 - a second application-specific object is an instantiation of the second subclass;
 - the second subclass comprises a second method comprising a second behavior of the second application-specific object; and
 - the second behavior of the second application-specific object corresponds to a second behavior of the object.
 - 8. (Currently Amended) The architecture system of claim 7 wherein invoking the first method performs the first method on the first application-specific object such that the object communicates as if the first method were performed on the object.

- (Currently Amended) The architecture system of claim 7 wherein
 invoking the second method performs the first second method on the second applicationspecific object such that the object communicates as if the second method were
 performed on the object.
- 10. (Currently Amended) The architecture system of claim 7 wherein modifying the first method does not affect the second method.
- 11. (Currently Amended) The architecture system of claim 7 wherein modifying the second method does not affect the first method.
- 12. (Original) A computer program product comprising: programming environment instructions for providing a programming environment comprising:
- identifying instructions to identify a first method and a second method to be performed on an object; wherein
- the object corresponds to an instantiation of class;
- developing instructions to develop the first method in a first application having a first subclass of the class wherein a first application-specific object is an instantiation of the first subclass;
- concurrent developing instructions to concurrently develop the second method in a second application having a second subclass of the class, wherein a second application-specific object is an instantiation of the second subclass;

and

- a computer-readable medium to store the programming environment instructions, the identifying instructions, the developing instructions, and the concurrent developing instructions.
- 13. (Currently Amended) The computer program product of claim 10 12 wherein invoking the first method performs the first method on the first application-specific object such that the object communicates as if the first method were performed on the object.

- 14. (Currently Amended) The computer program product of claim 10 12 wherein invoking the second method performs the first second method on the second application-specific object such that the object communicates as if the second method were performed on the object.
- 15. (Currently Amended) The computer program product of claim 10 12 wherein modifying the first method does not affect the second method.
- 16. (Currently Amended) The computer program product of claim 10 12 wherein modifying the second method does not affect the first method.
